Location: Astana
Citizenship: Kazakhstan, work permit: Kazakhstan
Willing to relocate: Almaty, Tashkent; willing to travel occasionally

Desired position and salary

Lead Analyst / Senior System Analyst | Integrations, API, BPMN, Team Management

Specializations:
- Business Analyst
- System Analyst

Employment type: full-time
Work format: on-site, hybrid, remote
Preferred commute time: no more than an hour

Work experience — 5 years 8 months

May 2025 — present
1 year 6 months

Lead Analyst

Unified Construction Portal (qportal.kz) — a full-cycle system for the construction industry with integrations with internal, private and government systems. Joined a project that had been in development for 5 years to bring key processes to pilot operation. Project team: 2 senior analysts.

Results:

- Prepared the system for transition to pilot operation from January 1, 2026 for all expert organizations in Kazakhstan: the key backlog was closed in 6 months (KVE, integrations with KDP, GBD FL and a private expert system). Since the beginning of 2026, 20,000+ applications have passed through the system.

- Redesigned the end-to-end SOAP integration with an external private expert system, for which the portal is the single point of entry: submission, review, payment, verification, remarks, deadlines, contracts and supplementary agreements, decision. Status model: ~20 statuses, 10 stages, ~30 use cases. Integration-related requests dropped from 10-15 to 0-3 per day.

- Designed the State Bank of Construction Projects (GBPS) module for the new Construction Code by July 1, 2026: proposed and agreed an extended MVP with the customer, launched on time. Processes under the old and new regulations in one system, an algorithm for distributing objects between state expertise and private expert organizations, migration of ~1,000 published projects without system downtime.

- In 2 weeks (3 days of analysis) embedded the missing VDK process for private expert organizations into the live system: reused the existing document-sending mechanism and integration methods instead of a separate module. Complaints from users and expert organizations stopped.

- Redesigned the main application review process in BPMN 2.0 (Camunda), put it into production and migrated in-progress applications to the new process; the number of stuck applications and user requests decreased.

- Designed the migration of 3,000+ correspondence documents from an external system with linking to applications: mapping, data structures, migration rules, integrity checks — no errors in logs and no customer complaints.

- As part of the team, stabilized the system after the pilot operation launch: defect-related requests decreased from ~30 to 0-10 per day within 6 months.

- Designed the logic for determining the UNO or registration number when forming IRD and PSD packages; prepared an instruction and methodology for the customer.

Responsibilities:

- Design business processes and status models: BPMN 2.0, AS-IS / TO-BE, State Machine, UML (Sequence, Activity).

- Design API contracts (REST, SOAP) with error handling, retry and idempotency.

- Describe role models and access rights, acceptance criteria; perform change impact analysis.

- Manage requirement changes after STPO approval: each change is either a replacement of a task within the current scope or a paid enhancement in the next year's contract.

- Decompose requirements into FE and BE tasks, ensure traceability from business goal to implementation; on average 1-2 task specifications per day.

- Prepare STPO, DTZ, TZ, SRS, API specifications, user guides; write test scenarios, conduct acceptance and demos for the customer.

Stack: REST, SOAP, JSON, XML, PostgreSQL, Postman, Swagger (OpenAPI), BPMN 2.0 (Camunda), UML, Jira, Confluence, Draw.io, Enterprise Architect, Balsamiq.

System Analyst -> Lead System Analyst -> Team Lead

DMMS (dmms.kz) — a full-cycle production management system for mining enterprises and processing plants, with integrations with industrial equipment and private and government systems. Joined at the stage of scaling to Kazakhstan and the CIS (Kyrgyzstan, Russia). Product company, ~70 people.

Results:

- Led a team that grew from 5 to 10-12 people (2 system analysts reporting to me, backend, frontend, QA): planning, deadlines, task decomposition and assignment, review of analysis; personally handled the analysis of key tasks.

- Responsible for implementation at 30+ sites: 6 Kazakhmys mines, a KazMinerals mine, a Polymetal processing plant, a Qarmet mine. Each mine has 100-500 system users and up to 1,000 tracked employees; launch timelines from 1 month (base module) to 1 year (full set of modules).

- Designed the migration of 9 DMMS domains from a monolith to microservices (all in production): service boundaries, API contracts, data models, integration events and protocols (REST, gRPC, Kafka, RabbitMQ). Domains: personnel and equipment positioning, transport management, access control, time tracking, etc.

- Designed the personnel positioning and emergency alert subsystem for mines: ingesting the data stream from sensors in cap lamps and on equipment (Insight Expert → RabbitMQ, ~200 events/s per mine), data model, route maps, monitoring of hazardous zones and downtime, monitoring of emergency signal delays, data validity rules.

- Qarmet: lead analyst of the project; designed the mine access process through 3 checkpoints with integrations with the ACS, the lamp room and the medical check system (300-500 people per shift, 24/7 operation); personally led the pilot operation launch and user training.

- Polymetal — the first implementation at a processing plant: brought the system to trial operation in 6 months (a milestone worth 40% of the contract value).

- Developed task specification templates and analysis standards: time spent preparing specifications decreased by 40% (according to Jira tracking); introduced regular reviews of analysis documentation, reducing the number of errors reaching development.

- When experienced analysts could not be hired on the market within budget, trained 3 interns and brought them to independent work within 6 months.

Responsibilities:

- Architecture and system logic: ER diagrams, BPMN, UML.

- Design of synchronous and asynchronous APIs and integrations, technical documentation.

- Role models and access rights, acceptance criteria, change impact analysis.

- Agreeing requirements with customers and on-site working groups, prototyping, demos and acceptance.

Stack: microservices, REST, gRPC, GraphQL, Kafka, RabbitMQ, SQL, NoSQL, Jira, Confluence, Postman, Swagger, Miro, Draw.io, Figma.

Business Analyst

MIS “Avicenna” (avicenna.online) — a medical information system for hospitals and outpatient clinics in Kazakhstan. Product team of ~20 people.

- Led the analysis for the implementation of MIS “Avicenna” at the National Research Oncology Center (~500 doctors and staff, 1,000+ patients per month): requirements, task specifications, support of enhancements up to commissioning and handover to support.

- Participated in designing and launching MIS integrations with the laboratory system, the donor system and PACS (transfer and archiving of medical images).

- Adapted the system to legislative changes: analysis of new regulations, formalization of requirements, handover to development.

- Prepared video and written user guides, conducted user training.

Additional information

About me

Lead analyst (system and business analysis), almost 6 years in enterprise projects: construction (Unified Construction Portal), mining (DMMS), healthcare (MIS “Avicenna”). Specialization — integrations and APIs (REST, SOAP, gRPC, Kafka, RabbitMQ), microservices, BPMN and status models, data migration. I take a task from requirements gathering to production.

Led a team of 10-12 people (analysts, backend, frontend, QA), was responsible for the project, deadlines and implementation at 30+ industrial sites (Kazakhmys, KazMinerals, Polymetal, Qarmet). Introduced analysis templates and reviews (–40% time on task specifications), grew 3 analysts from interns.

Brought systems into operation in three industries; I work under tight deadlines tied to legislation and contracts. Degree in information security.

I actively use AI (Claude) in analysis: finding bottlenecks and contradictions in requirements, analyzing large volumes of documentation, checking my own use cases for missed scenarios and details that affect the process. Built a project knowledge base in Claude and prepared instructions for quickly retrieving the information needed for a specific case. Interested in embedding AI features into enterprise systems.
